                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ACC6806), which are associated with tumour suppression, tumour reversion, apoptosis and virus resistance. The oligomucleotides are useful as (1) as probes and primers for detecting, identifying, quantifying and/or amplifying nucleic acid, e.g. as one component of a gene chip, in vitro as (anti)sense reagents; and (2) for production of recombinant polypebides. The oligomucleotides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.

The invention relates to enzymatic nucleic acids (I) i.e.
ribozymes/DNAzymes/Zinzymes that target and modulate expression of, genes
croribozymes/DNAzymes/Zinzymes that target and modulate expression of, genes
croribozymes/DNAzymes/Zinzymes that that the and/or VEGF receptor
(VEGFR1 and 2 encode by the FIt-1 and Kdr genes respectively). Also
croribozymes/DNAzymes/Electrical and carrier, administering
croribozymes/DNAzymes/Electrical and carrier, administering
croribozymes/DNAzymes/Electrical and carrier, administering
conjunction with one or more other drug by contacting the cell with the
compound and the other drug under conditions suitable for the
administration), administering (I) to a mammal (by contacting the mammal
crowith the compound under conditions suitable for the
administration) administering endometricois (by contacting the mammal
crowith, or administering to subject, a nucleic acid molecule (II) that
modulates expression of VEGF, VEGFRI, and/or VEGFR2), a mammalian cell
crompound and the chemotherapeutic agent under conditions suitable for the
modulates expression of VEGF, VEGFRI, and/or VEGFR2), a mammal with the
compound and the chemotherapeutic agent under conditions suitable for the
compound and the chemotherapeutic agent under conditions suitable for the
compound and the chemotherapeutic agent under conditions suitably to
human cell in the presence of a delivery reagent which is a lipid such as
cationic lipid or phospholipid, or a liposome. The enzymatic nucleic acid
molecule has an endonuclease activity to cleave RNA encoded by an VEGFR2
and/or VEGFR2 gene, and is in a hammerhead, inozyme, DNAzyme, G-cleaver,
cor Amberzyme configuration. The enzymatic nucleic acid molecule has an endonuclease activity to cleave RNA encoded by an VEGFR2
and/or VEGFR2 gene, and is in a hammerhead, inozyme, DNAzyme, G-cleaver,
cor Amberzyme configuration. The enzymatic nucleic acid
inhibiting subject having a condition associated with an increased level
cromible of the proposed of the proposed of the proposed of

of VEGF receptor, where the condition is cancer, e.g. breast cancer, lung cancer (such as non-small cell lung carcinoma), colorectal cancer, renal cancer (such as non-small cell carcinoma), pancreatic cancer. The enzymatic nucleac acids are useful for treating a subject (preferably human) having endometriosis, psoriasis, age-related macular degeneration, proliferative diabetic retinopathy, hypoxia-induced angiogenesis, rheumatoid arthritis, wound healing, endometrial carcinoma, gynecologic bleeding disorders, irregular menstrual cycles, ovulation, premenstrual syndrome, and emopausal dysfunction. The enzymatic nucleic acids are useful for birth control by inhibiting ovulation or embryonic uterine implantation. The present sequence is a target sequence from the human VEGFR2/Kdr mRNA. 888888888888888

Clinical assay system for assaying sample, has central controller, sample transfer module, nucleic acid extraction and measurement module, thermocycling module, primer extension module, mass spectrometry module analyzing sample.

Claim 6; SEQ ID NO 108; 207pp; English

The invention relates to a system for performing an assay on a biological sample, comprising a central controller programmed to exchange information about the biological sample with an outside system or database and exchange information about the biological sample with one or more modules of the system, a sample transfer module for transferring a portion of the sample to a first container, a nucleic acid extraction and for transferring the portion from the first container to a second container, a nucleic acid measurement module for measuring the portion and for transferring the portion from the first container to a second container, a nucleic acid measurement module for measuring the concentration of nucleic acids in the portion, a the portion module for adding PCR reaction materials to the portion, a thermocycling module for amplifying a target sequence and extending a primer in the portion, a primer extension preparation module for adding primer extension reaction materials to the portion, a mass spectrometry preparation module for

RESULT 95 ADR 70044

```
ö
removing a sample of the portion from the second container to a support for analysis by mass spectrometry and a mass spectrometry module for analyzing the sample. The invention also relates to an automated method for detecting mutations in a target gene. The diagnostic assay is an assay for detecting a pathogen in the sample. The pathogen is a virus, bacterium or fungus. The virus is a virus of the family Herpesviridae, preferably Cytomegalovirus (CMV). The system enables high accurate assays on nucleic acid sequences (e.g. clinically relevant nucleic acid sequences) using mass spectrometry. This sequence represents a DNA detection extension primer used in the scope of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention comprises the amino acid and coding sequences of SLC26A6, SLC26A1 and SLC26A2 anion transporter proteins. The DNA and protein sequences of the invention are useful for treating cancer. The present DNA sequence represents a splice site from the gene encoding the mouse SLC26A6 anion transporter protein.
                                                                                                                                                                                                                                                                 Gapa

chosen from one of 143 sequences given in the specification. (I) is useful for treating a mammal suffering from or susceptible from a disease caused by abnormal anglogenesis, by administering (I) containing one or more LNA units that are targeted to survivin. (I) is useful as a medicament and for the manufacture of a medicament for the treatment of cancer, in combination with chemotherapeutic agent such as busulfan (myleran), carboplatin (paraplatin), Taxol, doxorubicin (adriamycin), etc. (I) or a conjugate (II) containing (I) is useful in the preparation of a medicament for the treatment of atherosclerosis, psoriasis, diabetic carcinomant for the treatment of atherosclerosis, psoriasis, diabetic carcinoma of a solid tumour, sarcoma, glioma or carcinoma chosen from malignant melanoma, basal cell carcinoma, ovarian carcinoma, breast carcinoma, non-small cell lung cancer, strong carcinoma, bandcer carcinoma, ovariant carcinoma, prostatic carcinoma, pancreatic carcinoma, lung carcinoma, cervical dysplasia, laryngeal papillomatosis, colon carcinoma, colorectal carcinoma and carcinoid automous. The malignant melanoma is colorectal melanoma, and languatic melanoma, lentigo malignant melanoma, accinoma, and malignant melanoma, accinoma, accino
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Antisense therapy; apoptosis stimulation; neoplasm; carcinoma; melanoma; basal cell carcinoma; ovary tumor; breast tumor; broadcartumor; non-small-cell lung cancer; renal cell carcinoma; bladder tumor; mon-small-cell lung cancer; pancreas tumor; lung tumor; uterine cervix tumor; carcier; pancreas tumor; lung tumor; colorectal tumor; we arcoma; osteosarcoma; Kaposis sarcoma; anti-HIV; glioma; cytostatic; monocrine disease; gynecology and obstetrics; genitourinary disease; respiratory disease; musculoskeletal disease; dermatological disease; proliferative disorder; atherosclerosis; antiarteriosclerotic; cardiovascular disease; metabolic disorder; psoriasis; antipsoriatic; ardiovascular disease; coular disease; rheumatoid arthritis; antisevantic; inflammation; asthma; antiasthmatic; antiarthritic; antirheumatic; inflammation; asthma; antiasthmatic; verruca vulgaris; virucide; cell proliferation; apoptosis modulation; angiogenesis disorder; survivin; phosphorothioate; cytosine methylation; antisense oligonucleotide; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        melanoma. The sarcoma is chosen from osteosarcoma, Ewing's sarcoma, chondrosarcoma, malignant fibrous histiocytoma, fibrosarcoma and Kaposi's sarcoma. The treatment further involves administration of a chemotherapeutic agent such as taxanes, preferably Taxol, Paclitaxel or Docetaxel. (I), (II) or (III) is also useful for preventing or limiting apoptosis or for preventing cellular proliferation. This sequence corresponds to an antisense oligonucleotide targeted to the human

The invention relates to antibense originalities consisting or s-30 mucleotides and/or nucleotide analogs which inhibit expression of human survivin, an inhibitor of apoptosis which is also essential for cell division and angiogenesis. The antisense oligonucleotides comprise a subsequence of 8 or more nucleotides or nucleotide analogs, wherein the subsequence is located within a sequence selected from ADW0944-ADW09586. The oligonucleotides preferably contain one or more (preferably 6-10) nucleotide analogs, especially a locked nucleic acid (LNA), and also preferably contain a linkage group selected from a phosphate group, a phosphorothicate group or a boranophosphate group, and also crelates to a conjugate comprising a survivin antisense oligonucleotide of the invention and one or more non-nucleotide, and a pharmaceutical composition comprising a survivin antisense oligonucleotide or conjugate of the invention, optionally further comprising a chemotherapeutic agent. The survivin antisense oligonucleotide, and compositions containing them, are useful in the treatment of cancers such as carcinoma, breast carcinoma, heast carcinoma, basal cell carcinoma, bandder carcinoma, non-small cell lung cancer, renal carcinoma, particular carcinoma, recurrent superficial bladder cancinoma, cervical dysplasia, larryngaal carcinoma, carcinoma, cervical carcinoma, ecricoma, cervical carcinoma, ecricoma, cervical carcinoma, eliponucleotides are also useful cumors); asrcomas (e.g., osteosarcoma, Ewing's sarcoma, chondrosarcoma, cumors); asrcomas (e.g., osteosarcoma, Ewing's sarcoma, conditions such as atherosclerosis, psoriasis, diabetic retinopathy, rheumatoid arthritis, asthma, warts, and allergic certinopathy theumatoid arthritis, asthma, warts, and allergic certinopathy they may additionally be used for inhibiting cellular certinopathy they may additionally be used for inhibiting cellular cellular paperation, for modulating apportoria arthrisms allegence of securical such as a securical angiosence of securical such as a secur

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               (PETE/)
```

The invention relates to antisense oligonuclectides consisting of 8-50 nuclectides and/or nuclectide analogs which inhibit expression of human survivin, an inhibitor of apoptosis which is also essential for cell division and angiogenesis. The antisense oligonuclectides comprise a subsequence of 8 or more nuclectides or nuclectide analogs, wherein the subsequence of 8 or more nuclectides or nuclectide analogs, wherein the subsequence of 8 or more nuclectides or nuclectide analogs, wherein the subsequence of 8 or more nuclectides or nuclectide analogs, specially a locked nucleic acid (LNA), and also preferably contain a linkage group selected from a phosphate group, a phosphorothicate group or a boranophosphate group. The invention also cor or nuclectide or non-polymuclectide of the invention and one or more non-nuclectide or non-polymuclectide of the invention and one or more non-nuclectide or non-polymuclectide of composition and one or more non-nuclectide or non-polymuclectide of the invention and one or more non-nuclectide or non-polymuclectide of coft the invention and one or more non-nuclectide or non-polymuclectide or composition and one or more non-nuclectide or non-polymuclectide or conjugate of of the invention and one or more non-nuclectide or non-polymuclectide or conjugate of extension, are useful in the treatment of cancinoma, breast carcinoma, breast carcinoma, breast carcinoma, non-small cell lung cancer, renal cell carcinoma, cervical darcinoma, non-small cell lung cancer, renal cell carcinoma, cervical carcinoma, pancreatic carcinoma, cervical carcinoma, cervical darcinoma, cervical darcinoma, cervical serection pancreal carcinoma, cervical carcinoma, cervical serection pancreal carcinoma, cervical carcinoma, cervical carcinoma, sud Kaposi's sarcoma); or gliomas. The survivin antiense oligonuclectides are also useful in the retinopathy, rheumatoid arthritis, asthma, warts, and allergic dermatitis. They may additionally be used for inhibiting cellular cerimon, for modulating apoptosis and for tre

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /note= "Beta-D-oxy-LNAs (locked nucleic acid). All beta-D
related to abnormal angiogenesis. The survivin antisense oligonucleotide of the invention are shorter than prior art survivin antisense oligonucleotides (16-mers compared to 20-25-mers), therefore having increased specificity and affinity for survivin mRNA, and also have higher blosteablity and cell permeability. The present sequence represents a specifically claimed antisense oligonucleotide targeted to the human survivin cDNA target sequence shown in ADW09443.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   /bound moiety= "Bases 1568-1553 of human survivin cDNA (SEQ 1D NO:1)"

The invention relates to antisense oligonuclectides consisting of 8-50 aurolectides and/or nuclectide analogs which inhibit expression of human survivin, an inhibitor of apoptosis which inhibit expression of human survivin, an inhibitor of apoptosis which inhibit essential for cell division and anglogenesis. The antisense oligonuclectides comprise a ubsequence of 8 or more nuclectides or nucleotides analogs, wherein the subsequence is located within a sequence selected from ADW0944-ADW09586. The oligonucleotide analogs, especially a locked nucleic acid (LMA), and also preferably contain a linkage group selected from a phosphate group, a preferably contain a linkage group selected from a phosphate group, a preferably contain a linkage group selected from a phosphate group, a preferably contain and one or more non-nucleotide or conjugate comprising a survivin antisense oligonucleotide and a pharmaceutical composition comprising a survivin antisense oligonucleotide and a pharmaceutical composition comprising a survivin antisense oligonucleotide, and a pharmaceutical containing them, are useful in the treatment of cancers such as carcinoma, breast carcinoma, beast calcinoma, beast carcinoma, beast calcinoma, bradder carcinoma, passal cell carcinoma, lung cancer, renal cell carcinoma, prostatic carcinoma, passal cell carcinoma, lung carcinoma, prostatic carcinoma, passal cell carcinoma, lung carcinoma, prostatic carcinoma, and kaposi's sarcoma) on sension carcinoma, prostatic carcinoma, and kaposi's sarcoma) on sension carcinoma, prostatic carcinoma, and kaposi's sarcoma) on sension carcinoma, prostatic carcinoma, and carcinoma, prostatic carcinoma, and carcinoma, cervical carcinoma, prostatic carcinoma, and carcinoma, cervical carcinoma, prostatic carcinoma, and carcinoma, prostatic carcinoma, and carcinoma, prostatic carcinoma, and carcinoma, cervical dappacelerosis, psociasis, diabetic retinopathy, rheumatoid arthritis, asthma, warts, and allergic carcinoma are shorter than prostatic carcinoma and selected to abn
                                                                                                                                                                                                                                                                                                                                       treating e.g. cancers, atherosclerosis, psoriasis, diabetic retinopathy, rheumatoid arthritis, asthma, warts, or allergic dermatitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        higher biostability and cell permeability. The present sequence represents an antisense oligonucleotide targeted to the human survivin cDNA target sequence shown in ADW09443 used in an example of the

Wissenbach M; Thrue CA, Westergaard M, Petersen KD, WPI; 2005-100663/11 Hansen B,

New oligomeric compound for the modulation of survivin, useful for treating e.g. cancers, atherosclerosis, psoriasis, diabetic retinopathy, rheumatoid arthritis, asthma, warts, or allergic dermatitis.

Example 10; SEQ ID NO 595; 264pp; English.

The invention relates to antisense oligonucleotides consisting of 8-50 nucleotides and/or nucleotide analogs which inhibit expression of human survivin, an inhibitor of apoptosis which is also essential for cell division and anglogenesis. The antisense oligonucleotides comprise subsequence of 8 or more nucleotides or nucleotide analogs, wherein the subsequence is located within a sequence selected from ADW09444-ADW09586. The oligonucleotides preferably contain one or more (preferably 6-10) nucleotide analogs, especially a locked nucleic acid (LNA), and also preferably contain a linkage group selected from a phosphate group, a phosphorothioate group or a boranophosphate group. The invention also

cc relates to a conjugate comprising a survivin antisense oligonucleotide of the invention and one or more non-nucleotide or non-polymucleotide composition and one or more non-nucleotide or non-polymucleotide or conjugate composition comprising a survivin antisense oligonucleotide or conjugate of the invention, optionally further comprising a chemotherapeutic agent. The survivin antisense oligonucleotide or conjugate containing them, are useful in the treatment of cancers such as carcinoma, braset carcinoma, non-small call lung cancer, renal cell carcinoma, passet carcinoma, non-small call lung cancer, renal cell carcinoma, passet carcinoma, cervical carcinoma, cervical carcinoma, cervical carcinoma, cervical dysplasia, laryngeal carcinoma, carcinoma, cervical carcinoma, cervical dysplasia, laryngeal carcinoma, cervical carcinoma, fibrosarcoma, consense olgonucleotides (e.g., osteosarcoma, Ewing's sarcoma, chondrosarcoma, guinomas, The survivin antisense oligonucleotides (e.g., osteosarcoma, survivin antisense oligonucleotides (fe-mers compared to 20-25-mers), therefore having criates oligonucleotides (fe-mers compared to 20-25-mers), therefore having criates entents an antisense oligonucleotide targeted to abnormal analysements an antisense oligonucleotide targeted in an example of the invention are shorter than prior at survivin antisense compared to compare invention

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
           oligonucleotides (16-mers compared to 20-25-mers), therefore having increased specificity and affinity for survivin mRNA, and also have higher biostability and cell permeability. The present sequence represents an antisense oligonucleotide targeted to the human survivin CDNA target sequence shown in ADW09443 used in an example of the
                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; genome-derived myosin-like protein 1; GDMLP-1; hGDMLP-1; heart; muscle; myosin; chromosome 22; gene therapy; vaccine; heart disease; skeletal muscle disorder; amplicon; screening; ss.

hgDMLP-1 mucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 provide initial substrates for the recombinant engineering of hGDMLP-1 corporations, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as specifically of hGDMLP-1 proteins, as specifically concentration and/or amount specifically of hGDMLP-proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as character in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The collisorder associated with the expression of hGDMLP-1 may be used for diagnosing a disorders. hGDMLP-1 is localised to chromosome 22.

The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in the exemplification of the present invention. N.B.

The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO capture in the present sequence in the present sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

The invention relates to a novel polypeptide (I) comprising a sequence (S1) of myosin-like protein-1 (hGDMLP-1) having 2568 amino acids fully defined in the specification, a fragment of at least 8 amino acids of (S1), 95% deviation from (S1) which are conservative substitutions, and es% identity to (S1). A polypetide of the invention acts as a agonist or antagonist of hGDMLP-1, or as an inhibitor of hGDMLP-1 activity. A pharmaceutical composition of the invention is useful for treating or preventing a disorder associated with decreased expression or activity of hGDMLP-1, such as a disorder of heart and/or skeletal muscle function. The present sequence represents a 17-mer nucleotide, used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  UCP3; uncoupling protein 3; polymorphism; obesity; diabetes mellitus; ss.
                                                                                                                             Novel myosin-like protein-1, useful for treating or preventing disorder associated with decreased expression or activity of human genome-derived myosin-like protein-1 such as disorder of heart and/or skeletal muscle
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Nucleic acids encoding uncoupling protein 3 (mitochondrial, proton carrier) (UCP3) proteins comprising single nucleotide polymorphisms, useful for the design of drugs for treating obesity.
                                                                  Shannon MB;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                          invention for scanning the sequence represented in ACN63103

a neovascular condition of the retina,

hyperneovascular condition such as

```
ö
The present invention relates to the human uncoupling protein 3 (mitochondrial, proton carrier) (UCP3) gene and polymorphisms. The polymorphisms are associated with obesity, especially diabetes mellitus associated obesity. They polymorphisms may be identified and analysed to determine whether an individual is susceptible to obesity and may be used as the basis for targeted design of drugs to treat obesity. The present sequence was used in the identification and amplification of UCP3

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inhibiting or reducing growth factor mediated cell proliferation, oligonucleotide which can be used to design the antisense oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF45151 and AAF45153-F5151). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a

In the mutated EIAVGeleudu gene of the invention, this portion of the DU gene is ligated to a 5' fragment (see ABL53809) of the gene, to produce a DU gene-deleted construct (see ABL53811). The invention describes a vaccine for effectively and safely immunising mammals, especially equids, from disease caused by BIAV, the vaccine being tested for efficacy or immunogenicity using an EIA equine challenge model of the invention. The vaccine is a gene-deleted BIAV, each of gene-deleted EIAV, which lacks the ability to express the mutated gene protein in vivo, this lack of expression being useful to differentiate vaccinated from non-vaccinated or infected mammals. The multiple low dose EIA challenge model of the invention can be used to determine the efficacy of vaccines, treatments and diagnostic tests
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           does not include a start or stop codon"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     reproduce natural infection model which is useful for evaluating immunogenicity of BIAV vaccine, involves administering a median horse infective dose to equine.
                                                                                                                                                       Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Genotyping human Ran GTPase activating protein 1 gene of individual for determining haplotype of individual, involves determining identity of nucleotide pair at specific polymorphic sites for two copies of the gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       (SNPB) in the human Ran GTBase activating protein 1 (RANGAPI) gene located on chromosome 22q13.2-q13.31, and methods for haplotyping and/or genotyping the RANGAPI gene. The methods of the invention make use of allele-specific oligonucleotides (ASOB) as probes and primers and/or primer-extension oligonucleotides for detecting the RANGAPI gene polymorphisms. The polynucleotides and screened compounds are useful for treatment of diseases associated with RANGAPI activity, such as cancer and other disorders associated with an irregular cell cycle. AAS19704-AAS19742 represent ASO probes for detecting human RANGAPI gene polymorphisms
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               present invention relates to novel single nucleotide polymorphisms

dUTPase;

Squine infectious anemia virus DU gene 3' fragment

(first entry)

25-JUN-2002

ABL53795

```
The present sequence is a 3' fragment of the dUTPase (DU) gene coding sequence of equine infectious anemia virus (SIAV). In the mutated ELAVACELLEDU gene of the invention, this portion of the DU gene is ligated to a 5' fragment (see ABLS3794) of the gene, to generate the sequence of given in ABLS3796. Two Styl sites flanking the gene are used to create the deletion, removing 80% of the DU coding sequence, including 4 of 5 conserved amino acid motifs. The invention relates to ElA vaccines that provide immunity to mammals, especially to equines, from infection with provide immunity to mammals, especially to equines, from infection with the ELAV, and which allow differentiation between vaccinated and nonvaccinated, but exposed, animals. The vaccine has at least 1 mutation in the ELAV, e.g. the present DU gene-mutated ELAV construct, which produces not reduce the ability of the mutated ELAV construct, which produces not reduce the ability of the mutated ELAV replicate in cell culture, allowing large-scale vaccine production. The vaccine cannot cause constraind disease or spread to other animals. The mutated region can also be used as an insertion point for foreign genes, using ELAV as a vector
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ô

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention provides the protein and coding sequences of human fructose-bisphosphate aldolase B (ALDOB) and single nucleotide bolymorphisms (SNRs) which have been identified in each sequence. The method of haplotyping the sequences is useful for haplotyping the fructose-biphosphate aldose B (ALDOB) gene of an individual or for validating the ALDOB protein as a candidate target for treating a medical condition predicted to be associated with ALDOB activity. The present sequence is an allele-specific primer/probe used to identify the haplotype of the human ALDOB gene in the exemplification of the invention

New peptides having growth inhibitory action, useful for inhibiting tumor or cancer cell proliferation, or for treating fibrotic disorders, myeloproliferative diseases, and blood vessel proliferative (anglogenic)

The invention relates to an isolated peptide or polypeptide (I) of no more than about 50 amino acid residues which when contacted with cells in which a platelet-derived growth factor receptor (PDGP-R) is activated in an autocrime manner, inhibits the growth of these cells. The isolated peptides or polypeptides preferably have the sequences: Lys-Lys-Lys-Lys-Lys-Lys-Lys-Bhe-Phe-His-Pro-Val (FS). [I) is useful for inhibiting cell proliferation, where the cell is a tumor or cancer cell (e.g. carcinoma, carcoma, osteosarcoma, glicoma, melanoma, myroma, adenoma, neuroblastcoma, or rhabdomyoma-derived cell), lung, breast, colon, prostate, kidney, ovary, testicular, skin, pancreatic, thyroid, adrenal, pituitary, brain, muscle or bone cell. The peptides are also useful for treating fibrotic disorders myeloproliferative diseases, and blood vessel proliferative (anglogenic) disorders. This sequence represents a possible nucleotide encoding the P3 peptide. Gaps ö 15.3%; Score 11.8; DB 1; Length 15; 86.7%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to an isolated peptide or polypeptide (I) of no more than about 50 amino acid residues which when contacted with cells in which a platelet-derived growth factor receptor (PDGF-R) is activated in an autocrine manner, inhibits the growth of these cells. The isolated peptides or polypeptides preferably have the sequences: Lys-Lys-Lys-Lys-Lys (P4) Pap-Abp-Glu-Glu-Lys (P2) Fys-Leu-Hat-Parcy-Ris (P4) Phe-Phe-His-Pro-val (P5). (I) is useful for inhibiting cell proliferation, where the cell is a tumor or cancer cell (e.g. carcinoma, sarcoma, osteosarcoma, glioma, melanoma, myxoma, adenoma, neuroblastoma, or rhabdomyoma-derived cell), lung, breast, colon, prostate, kidney, ovary, testicular, skin, pancreatic, thyroid, adrenal, pituitary, brain, muscle or bone cell. The peptides are also useful for treating fibrotic disorders, myeloproliferative diseases, and blood vessel proliferative (angiogenic) disorders. This sequence represents a possible nucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New peptides having growth inhibitory action, useful for inhibiting tumor or cancer cell proliferation, or for treating fibrotic disorders, myeloproliferative diseases, and blood vessel proliferative (angiogenic)
                                                                                                                                                                                                                                                                             ss; cytostatic; platelet-derived growth factor receptor; PDGF-R; cancer;

mammals vaccinated with the gene-mutated constituted and a meableable level of the expression product or amount of the normal gene sequence in infected mammals) and a method of differentiating a vaccinated mammal comprishing obtaining a sample from a test mammal, and analysing the sample for the presence of a gene expression product normally produced by wild-type EIAV but not produced by the EIAV construct cited above). The two redundant stop codons are inserted into the S2 open reading frame at positions corresponding to amino acids Gly5 and Gly18. The stop codon does not affect normal expression of the convergence of a least 7 base pairs downstream of the stop codon of the second coding region of TAT. The deletion does not interrupt the splice donor 2 site downstream of the stop codon of the second coding region of The initiation codon of the Scopen reading frame. The generation of the initiation codon of the Scopen reading frame. The generation of the initiation codon of the Scopen reading frame. The generation of the initiation codon of the Popen reading frame. The generation of the initiation codon of the Scopen reading frame. The generation of the initiation coden of the State of the face of the face of the second coding region of a restriction endonuclease site where the restriction endonuclease is a molecular marker for differentiating between wild type EIAV and the construct is useful for immunising mammals (e.g. horses) against lentiviral diseases, particularly BIAV infection. The contemplated in the DU (dUTPase) game of EIAV. The present sequence is the wild-type EIAV DU 5' or 3' end.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a construct comprising a gene-mutated equine infectious anemia virus (BIAV) comprising two redundant stop codons and a deletion (in the S2 protein) where the virus lacks the ability to express the mutated gene protein in vivo and where the lack of expression can be used to differentiate vaccinated from non-vaccinated or infected mammals. Also included are a diagnostic test for differentiating mammals waccinated with the above construct from non-vaccinated mammals infected mammals (comprising one or more reagents for demonstrating the absence of a normal BIAV gene expression product or a normal gene sequence in mammals vaccinated with the gene-mutated construct and a measurable level
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New construct comprising gene-mutated equine infectious anemia virus (EIAV) for providing immunity from diseases caused by EIAV and allowing diagnostic differentiation between vaccinated and non-vaccinated mammals
                                                                                                                                                                                                                                    EIAV; S2 protein; vaccine; envelope protein; Tat protein;

```
the sequence represents a consensus 16 base pair repeat found in the human cytamegalovirus promoter regulatory region of the major immediate arrly gene, representing the nucleotides most frequently found within the 16n repeat. The promoter region contains the typical TATA and CAAT boxes and three different sets of repeat sequences, designated 19n, 18n and 16n repeats. Bach repeat sequence is repeated at least 4 times. There is a 2n repeat sequence splay a critical role in the relative level of expression of the downstream gene. Experiments using various deletions of the regulatory sequences suggest a direct correlation between the number of repeats and the relative level of gene expression. Hence these sequences or adjacent sequences constitute a component of the regulatory region that enhances the level of expression of the adjacent gene. These
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The sequence represents a 16 base pair repeat found in the human cytamegalovirus promoter regulatory region of the major immediate early gene from nucleotides -371 to -356 (distance from the cap site). The promoter region contains the trylical TMTA and CAAT boxes and three different sets of repeat sequences, designated 19n, 18n and 16n repeats Bach repeat sequence is repeated the repeat dequence and/or the sequence which is repeated twice. The repeat sequence and/or the surrounding sequences play a critical role in the relative level of expression of the downstream gene. Experiments using various deletions of the regulatory sequence suggest a direct correlation between the number of repeats and the relative level of gene expression. Hence these sequences constitute a component of the regulatory region that enhances the level of expression of the adjacent gene. These components are referred to as enhancers or adjacent sequences. The IEPR region includes 19n, 18n and 16n repeat sets, each repeated 4 times, and a 21n set repeated twice. The 16n set is given in AAQ81491-94, with the consensus in AAQ81490. (Updated on 25-MAR-2003 to correct PP field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New transfer vectors for gene expression – comprising the immediate-early promoter regulatory region of human cytomegalovirus.

AAQ81478, enhances the transcription and expression of adjacent genes in human cells, and has been used to construct gene transfer vector pIEPR12 (NRKL B-15930). The IEPR region includes 19n, 18n and 16n repeat sets, each repeated 4 times, and a 21n set repeated twice. The 16n set is given in AAQ81491-94, with the consensus in AAQ81490. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New retroviral vectors, particularly for gene therapy - which are free of
the gag coding sequence, to provide for high levels of gene expression,
viral titre and packaging efficiency.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The fusion sites AAV26756-V26760 were used in the production of two retroviral vectors (RV). The first is a RV that has no gag coding sequence is capable of delivering a gene of interest to a target cell when packaging functions of gag, pol and env are provided. The second is a RV based on murine leukaemia virus (MLV) where entire gag and env coding sequences are completely deleted. The vectors can be used for gene
                                                                                                                                    New transfer vectors for gene expression - comprising the immediate-early promoter regulatory region of human cytomegalovirus.

The invention relates to single nucleotide polymorphisms in the gene encoding human 5-hydroxytryptemine (serotonin) receptor 5A (HTRSA). A method for haplotyping the HTRSA gene in an individual comprises identifying the nucleotide at one or more polymorphic sites and determining whether one of the copies of the gene is defined by one of the HTRSA haplotypes given in the specification or whether both copies the HTRSA haplotype pairs can be assigned to specific genotypes. An association between a trait and a haplotype or haplotype pairs can be identified by comparing the frequency of the haplotype pair in a population exhibiting the trait with the haplotype or haplotype pair in a population exhibiting the trait with the haplotype or haplotype pair in a population of the haplotype or haplotype pair in a population of the haplotype or haplotype pair in a population in a reference the trait is associated with the haplotype or haplotype pair. HTRSA and its corresponding DNA are used for studying the expression and in screening for candidate drugs to treat diseases related to HTRSA activity, such as neurological disorders, including depression and epilepsy. Sequences ABK72139-ABK72358 represent allele-

The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, corputal nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The coligomers are also used for detecting cell type differentiation. ABC0010-ABC99999, ABF00010-ABF99999 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in alectronic format from WIPO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                        This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, contral nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF9989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonuclectide, (for Insulin-IR Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBD], which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonuclectide which can be used to design the antisense oligonuclectides of the present invention (see AAF4515.1 and AAF45153-F45161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, ruba, pilaris, serbornhoea, kelolids, keratosis, neoplasis, scleroderma, warts, benign growths, cancers of the skin, a hyperneovasqular condition such as a neovascular condition of the retina,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  brain or skin, growth factor-mediated malignancies, other scierotic disease, kidney disease, hyperproliferation of the inside of blood

The method comprises contacting the skin with an antisense oligonucleotide, (for Inaulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBPB), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotide which can be used to design the effects of psoriasis, oligonucleotides of the present invention (see AAF45151 and AAF45153-F45161). The method is useful for ameliorating the effects of psoriasis, inthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, sclaroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina,

Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or inflammation.

Example 7; Page 58; 201pp; English.

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an entitle ene oligonucleotide, (for Insulin-like Growth Factor [IGP]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotide which essent invention (see AAF45151 and AAF45153-F4516). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a neoplasias, sinch factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood vessels or any other hyperplasia AAP48759

Enzymatic nucleic acid molecules able to cleave separate RNA molecules are used for treating cancer, Alzheimer's disease, hepatitis, diabetes, obesity and heart disease.

Example 7; Page 490; 717pp; English.

The present invention relates to the use of enzymatic nucleic acid molecules (e.g. ribozymes) to modulate gene expression. The invention also methods for their use to down regulate or inhibit the expression of genes encoding protein-tyrosine-phosphatase-lb (PTB-1B), methionine aminopeptidase (MetAP-2), human telomerase (HTBT), protein Kinase C alpha (PKC alpha), beta-secretase (BACE), human epidermal growth factor receptor-2 (pg-2), and hepaticis B virus (HBV) proteins. The enzymatic nucleic acid molecules used to inhibit the expression of the said genes include hammerhead (HH), hairpin, NCH (inozyme), G-cleaver, amberzyme, cinclude hammerhead (HH), hairpin, NCH (inozyme), G-dreaver, amberzyme, cinclude hammerhead (HH), hairpin, NCH (inozyme), G-dreaver, amberzyme, cinclude hammerhead diseases e.g. heart disease, age-related diseases, hepatitis B infections, and hepatitis and hepatitis and hepatitis and hammerhead as carcinoma. The enzymatic nucleic acid molecules can also be used as diagnostic tools to examine genetic drift and mutations within diseased

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Š
                                                                                                                                                                                                                                                          ö
cells and to detect the presence of specific RNA in a cell. The present sequence represents a substrate/target sequence for an anti-HER2 NCH ribozyme used in the examples of the present invention. Note: Some SEQ ID Nos are repeated more than once in the specification, but these have different sequences associated with them.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention provides the protein, gene and cDNA sequences of human colony stimulating factor 3(granulocyte) CSF3. Also described are single nucleotide polymorphisms (SNPs) identified within these sequences. The sequences can be used in the treatment of neutropenia, promyelocytic leukaemia and haematological disorders. The present sequence is an allele specific primer used to isolate the coding sequences of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New variants of colony stimulating factor 3 (CSF3) isogenes, useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; colony stimulating factor 3(granulocyte); CSP3; SNP; isogene; chromosome 17q11-12; single nucleotide polymorphism; immunostimulant; neutropenia; promyelocytic leukaemia; haematological disorder; gene therapy; PCR; prime; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention provides the protein, gene and cDNA sequences of human P450(cytochrome) oxidoreductase POR, and single nucleotide polymorphisms (SNPs) identified therein. The sequences can be used to haplotype the POR gene of an individual, and to establish whether POR is a suitable target for drugs to treat cancer and disorders associated with impaired protein synthesis in cells. The present sequence is an allele specific probe for the coding sequences of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New genetic variants comprising haplotypes of the P450 (cytochrome) oxidoreductase (POR) isogene, useful in improving the efficiency of drug screening protocols for compounds targeting POR.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       88; cytostatic; platelet-derived growth factor receptor; PDGF-R; cancer;

RESULT 134

```
The invention relates to an isolated peptide or polypeptide (1) of no more than about 50 amino acid residues which when contacted with cells in which a platehet-derived growth factor receptor (PDGFR.) is activated in an autocrine manner, inhibits the growth of these cells. The isolated in an autocrine manner, inhibits the growth of these cells. The isolated competides or polypeptides preferably have the sequences: Lys-Lys-Lys-Lys (PA) App-App-Glu-Lys (P2) Lys-Leu-Met-Ser-Tyr (P3) Phe-Phe-His-Pro-Val (P5). (1) is useful for inhibiting cell proliferation, where the cell is a tumor or cancer cell (e.g. carcinoma, arcoma, osteosarcoma, glioma, melanoma, menoma, neuroblastoma, or rhabdomyoma-derived cell), lung, breast, colon, prostate, kidney, ovary, testicular, skin, pancreatic, thyroid, adrenal, pituitary, brain, muscle or bone cell. The peptides are also useful for treating fibrotic disorders, mysloproliferative diseases, and blood vessel proliferative (anglogenic) disorders. This sequence represents a possible nucleotide encoding the P3 peptide.
                                                                                                                                                                                                                                  New peptides having growth inhibitory action, useful for inhibiting tumor or cancer cell proliferation, or for treating fibrotic disorders, myeloproliferative diseases, and blood vessel proliferative (angiogenic)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ss; cytostatic; platelet-derived growth factor receptor; PDGF-R; cancer; carcinoma; sarcoma; osteosarcoma; glioma; melanoma; myxoma; adenoma; neuroblastoma; rhabdomyoma-derived cell; fibrotic disorders; myeloproliferative disease; blood vessel proliferative disease;

The invention relates to an isolated peptide or polypeptide (I) of no more than about 50 amino acid residues which when contacted with cells in which a platelet-derived growth factor receptor (PDGP-R) is activated in an autocrine manner, inhibits the growth of these cells. The isolated peptides or polypeptides preferably have the sequences: Lys-Lys-Lys-Lys-Lys-Asp-Glu-Glu-Lys (P2) Lys-Lew-Het-Ser-Tyr (P3) Phe-Phe-Phe-Lys-Lys (P4) Phe-Phe-His-Fro-Val (P5) (I) is useful for inhibiting cell proliferation, where the cell is a tumor or cancer cell (e.g. carcinoma, carchoma, osteosarcoma, osteosarcoma, machanoma, machanoma, neuroblastema, or rhabdomyoma-derived cell), lung, breast, colon, prostate, kidney, ovary, testicular, skin, pancreatic, thyroid, adrenal, pituitary, brain, muscle or bone cell. The peptides are also useful for treating fibrotic disorders, myeloproliferative diseases, and blood vessel proliferative (anglogenic) disorders. This sequence represents a possible nucleotide encoding the P3 peptide.
                     New peptides having growth inhibitory action, useful for inhibiting tumor or cancer cell proliferation, or for treating fibrotic disorders, myeloproliferative diseases, and blood vessel proliferative (angiogenic)
                                                                                                                                                                        Disclosure; SEQ ID NO 169; 48pp; English.

New peptides having growth inhibitory action, useful for inhibiting tumor or cancer cell proliferation, or for treating fibrotic disorders, myeloproliferative diseases, and blood vessel proliferative (angiogenic) disorders.

```
The invention relates to an isolated peptide or polypeptide (1) of no more than about 50 amino acid residues which when contacted with cells in which a platelet-derived growth factor receptor (PDGP-R) is activated in autocrine manner, inhibits the growth of these cells. The isolated in autocrine manner, inhibits the growth of these cells. The isolated peptides or polypeptides preferably have the sequences: Lys-Lys-Lys-Lys (PA) hap-Abp-Glu-Lys (P2) Exer-Lyr (P2) Phe-Phe-Phe-Liys-Lys (P4) Phe-Phe-His-Pro-Val (P5). (1) is useful for inhibiting cell proliferation, where the cell is a tumor or cancer cell (e.g. carcinoma, arcoma, osteosarcoma, glidma, melanoma, myxoma, adenoma, neuroblastoma, or rhabdomyoma-derived cell), lung, breast, colon, prostate, kidney, ovary, testicular, skin, pancreatic, thyroid, adrenal, pituitary, brain, muscle or bone cell. The peptides are also useful for treating fibrotic disorders, mycloproliferative diseases, and blood vessel proliferative classing the P3 peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 15 BP; 4 A; 3 C; 3 G; 5 T; 0 U; 0 Other;

useful for inhibiting tumor fibrotic disorders, proliferative (anglogenic) New peptides having growth inhibitory action, or cancer cell proliferation, or for treating myeloproliferative diseases, and blood vessel

Disclosure; SEQ ID NO 161; 48pp; English

The invention relates to an isolated peptide or polypeptide (I) of no more than about 50 amino acid residues which wan contacted with cells in which a platelet-derived growth factor receptor (PDGF-R) is activated in an autocrine manner, inhibits the growth of these cells. The isolated

peptides or polypeptides preferably have the sequences: Lys-Lys-Lys-Lys-Lys-Lys-lys (P1) Asp-Asp-Glu-Glu-Lys (P2) Lys-Leu-Met-Ser-Tyr (P3) Phe-Phe-Phe-Lys-Lys (P4) Phe-Phe-His-Pro-Val (P5). (I) is useful for inhibiting cell proliferation, where the cell is a tumor or cancer cell (e.g. carcinoma, sarcoma, osteosarcoma, glioma, melanoma, myxoma, adenoma, neuroblastoma, or rhabdomyoma-derived cell), lung, breast, colon, prostate, kidney, or vory, testicular, skin, pancreatic, thyroid, adrenal, pituitary, brain, muscle or bone cell. The peptides are also useful for treating fibrotic disorders, myeloproliferative diseases, and blood vessel proliferative (angiogenic) disorders. This sequence represents a possible nucleotide

New peptides having growth inhibitory action, useful for inhibiting tumor or cancer cell proliferation, or for treating fibrotic disorders, myeloproliferative diseases, and blood vessel proliferative (angiogenic) disorders.

Disclosure; SEQ ID NO 113; 48pp; English.

The invention relates to an isolated peptide or polypeptide (I) of no more than about 50 amino acid residues which when contacted with cells in which a platelet-derived growth factor receptor (PDGF-R) is activated in an autocrine manner, inhibits the growth of these cells. The isolated peptides or polypeptides preferably have the sequences: Lys-Lys-Lys-Lys-Lys-Lys-Lys (P1) Asp-Asp-Glu-Glu-Lys (P2) Lys-Leu-Met-Ser-Tyr (P3) Phe-Phe-Lys-Lys (P4) Phe-Phe-His-Pro-Val (P5). (I) is useful for inhibiting cell prollferation, where the cell is a tumor or cancer cell (e.g. carcinoma, sarcoma, osteosarcoma, glioma, melanoma, myxoma, adenoma, neuroblastoma, or rhabdomyoma-derived cell), lung, breast, colon, prostate, kidney,

```
ovary, testicular, skin, pancreatic, thyroid, adrenal, pituitary, brain, muscle or bone cell. The peptides are also useful for treating fibrotic disorders, myeloproliferative diseases, and blood vessel proliferative (angiogenic) disorders. This sequence represents a possible nucleotide encoding the P3 peptide.

New peptides having growth inhibitory action, useful for inhibiting tumor or cancer cell proliferation, or for treating fibrotic disorders, myeloproliferative diseases, and blood vessel proliferative (angiogenic) disorders.

Disclosure; SEQ ID NO 179; 48pp; English.

The invention relates to an isolated peptide or polypeptide (1) of no more than about 50 amino acid residues which when contacted with cells in which a platelet-derived growth factor receptor (PDGFR) is activated in an autocrine manner, inhibits the growth of these cells. The isolated peptides or polypeptides preferably have the sequences: Lys-Lys-Lys-Lys (P4) Asp-Asp-Glu-Glu-Lys (P2) Lys-Leu-Met-Ser-Tyr (P3) Rhe-Phe-Phe-Lys-Lys (P4) Phe-Phe-His-Pro-Val (P5). (1) is useful for inhibiting cell proliferation, where the cell is a tumor or cancer cell (e.g. carcinoma, orthograrcoma, osteosarcoma, glioma, melanoma, meyone, adenoma, neuroblastoma, or rhabdomyoma-derived cell), lung, breast, colon, prostate, kidney, ovary, testicular, skin, pancreatic, thyroid, adrenal, pituitary, brain, muscle or bone cell. The peptides are also useful for treating fibrotic disorders, myeloproliferative diseases, and blood vessel proliferative (angiogenic) disorders. This sequence represents a possible nucleotide encoding the P3 peptide.

                    ADB13707,
                               The present sequence represents a polymucleotide that is able to form a triple helix with a double stranded sequence. Cytosine bases in the present can be replaced with 5-methylcytosine for increased triplex stability. The present sequence is used in the assay of the invention, where it can be part of the anchor DNA or reporter DNA sequence. The assay comprises adding a sample containing double-stranded DNA test sequences to an aqueous medium containing double-stranded DNA test sequences to an aqueous medium containing at least one complex of anchor DNA, attached to a solid support, and reporter DNA, where either a part of the anchor DNA or reporter DNA is designed to form a triple-strand structure with part of the test sequence. Triplex formation results in displacement of the presence of the DNA which is detected as an indication of the presence of the DNA test sequence. The method is used to detect DNA sequences, particularly for identification of bacteria (by detecting the presence of the DNA test sequence) but also detection of

```
The invention describes an oligonucleotide comprising 10-100 bases, in which at least 2 bases are juxtaposed universal bases. Also disclosed is a method for detecting a polymorphism in a genetic material comprising contacting a DNA with the new oligonucleotide, and identifying whether the oligonucleotide bound to the DNA. The novel oligonucleotide is used for diagnostic purposes, e.g. detection of single nucleotide polymorphisms (SNPS). It is also applicable in array technology, sequencing, and shoridisation. The method increases the ability to differentiate a single nucleotide polymorphism or a polymorphic site from a normal site and allows the development of more efficient diagnostics
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

The invention describes an oligonucleotide comprising 10-100 bases, in which at least 2 bases are juxtaposed universal bases. Also disclosed is a method for detecting a polymorphism in a genetic material comprising contacting a DNA with the new oligonucleotide, and identifying whether the oligonucleotide bound to the DNA. The novel oligonucleotide is used for diagnostic purposes, e.g. detection of single nucleotide is used polymorphisms (SNPs). It is also applicable in array technology, sequencing, and hybridisation. The method increases the ability to differentiate a single nucleotide polymorphism or a polymorphic site from a normal site and allows the development of more efficient diagnostics and therapeutics. This sequence represents an oligonucleotide of the invention. Note: This sequence differs from the sequence given in the
                                                                                                                                                                                                                                                                                                                                      polymorphism detection; diagnostic; ingle nucleotide polymorphism detection; SNP detection; array technology; sequencing; hybridisation; ss; probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New oligonucleotide for diagnostic purposes, e.g. detection of single nucleotide polymorphisms, comprises universal and generic bases.
                                                                                                                                                                                                                                                                          Oligonucleotide probe for diagnostic purposes seq id 26

The oligonucleotides of the invention are useful as primers and probes for diagnosing diseases, particularly in detecting polymorphism in a sample of genetic material and for diagnosing a genetic disease in a patient. The present sequence is a probe used to identify mutations or polymorphisms. This sequence used in the exemplification of the invention.
                                                                                                                                                                                                                                  numbers of 3-nitropyrrole group"

The sequences given in AAT18103-11 are primers which may be used in the species-specific amplification of M. kansasii DNA. These primers bind to a fragment, bases 51-220, of the clone p6123. p6123 is a cloned probe which hybridises to all M. kansasii strains, including the subgroup which is negative to binding with the probe pWK1-9 (M.Yang et al. 1993. J. clin. Microbid. 31, 2769-2772). These primers are pref. used in strand displacement amplification (SDA). These primers showed a positive reaction with 74 M. kansasii isolates tested, but did not cross react with any other Mycobacterium species. In addition, these primers did not cross-react with Nocardia asteroides or Rhodococcus rhodochrous. This primer binds around bases 141-156 of the p6123 fragment
                                                                                                                                                                                                                                              Primers for species-specific amplification of Mycobacterium kansasii -detect double stranded target sequences with no cross-reactivity between
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Mutant replication-defective flavivirus; arthropod vector; 31 stem-loop structure substitution; Dengue virus type 2; DSN2; West Nile virus; WN; Flavivirus-induced infection; dengue fever; dengue haemorihagic fever; dengue shock syndrome; viructide; se.

The oligonucleotides of the invention are useful as primers and probes for diagnosing diseases, particularly in detecting polymorphism in a sample of genetic material and for diagnosing a genetic disease in a patient. The present sequence is a probe used to identify mutations or polymorphisms. This sequence used in the exemplification of the invention.
                                                                                                                                                              i. .5

The present invention relates to a mutant replication-defective flavivirus having a genome with a 3' stem-loop structure substitution, and being defective for replication in an arthropod vector that transmits flavivirus to humans. The genome is selected from a first flavivirus and the 3' stem-loop structure from a second flavivirus, where the first flavivirus may be negrous is different from the second flavivirus, where the first flavivirus may be negrous is different from the second. For example the first flavivirus may be west nite for treating flavivirus-induced infections, particularly dengue fever or dengue haemorrhagic fever/shock syndrome. The present sequence represents a part of the My genome used to construct a mutant replication on 07-AUG-2003 to correct OS field.)
New mutant replicon-defective flavivirus having a genome with a 3' stem-
loop structure chimeric substitution useful as vaccine for treating
flavivirus-induced infection e.g. dengue fever, dengue hemorrhagic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Cyclin D1 promoter; CD40L promoter; hepatitis B virus promoter;

The invention describes an isolated nucleic acid regulatory sequence for a cyclin DI promoter, a CD40L promoter, vancomycin-resistant enterococci (VRB) promoter. Human epidermal growth factor receptor 2 (HER2) promoter, or a beta lactamase cyclin DI promoter. Transcription regulatory sequences may be used to require expression of the endogenous, autologous or heterologous genes operably linked to the promoter, and may be incorporated into heterologous nucleic acid constructs for use in regulated expression of transgenes. Regulated expression of cyclin DI can be used in cancer therapies, such as breast, colon or pancratic cancers and familial adenomatous polyposis. Regulation of the activity of CD40L gene promoter may be used in the treatment of immunological disorders, and as a utolimmune diseases e.g. multiple sclerosis (MS), systematic lupus crythematosus (SLB), graft-vs-host disease (GVHD) and rheumatold carthritis. Regulated expression of genes under the control of the HBV (hepatitis B)-specific core, pre-5 and X promoters can be used in the therapy of HBV disease, chronic hepatic insufficiency, cirrhosis, hepatocellular carcinoma, and in the regulated expression of the vanH gene promoter can be used in treatment of Bnterococcus infection, while regulated expression of the androgen receptor gene can be used in the invention to determine the functions of regions within the selected promoters, cancer This sequence represents a primer used in the invention to determine the functions of regions within the selected promoters, New nucleic acid regulatory sequences, which are able to regulate expression of a gene operably linked to a promoter, useful for regulating the expression of transgenes and for treating e.g., cancer and HIF-lalpha, hypoxia-inducible factor-1 alpha, human; antisense; cancer; pre-eclampsia; cytostatic; gynaecological; antiinflammatory; nootropic; Gaps ö 14.5%; Score 11.2; DB 1; Length 16; 81.2%; Pred. The present invention relates to compounds capable of modulating hypoxia-
inducible factor-lalpha (HIFIa). The compounds are used to treat patients
with, or at risk of developing, cancer (e.g. of breast, prostate,
pancreas, lung), pre-eclampsia, inflammatory bowel disease or Alzheimer's
disease, for modulating angiogenesis, proliferation of erythrocytes and
other cells, iron, glucose and energy metabolism, pH regulation, tissue
invasion, apoptosis, multiple daresty metabolism, pH regulation, tissue
and matrix metabolism, especially apoptosis where modulation is
sensitivity to an apoptotic stimulus, particularly a chemotherapeutic
agent and for inhibiting proliferation of cells (especially cancer cells)
in vitro. The present sequence is an antisense oligomuclocide against
HIFlalpha identified in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to identifying (M1) genes in vitro that, in humans or animals, are important for skin ageing and/or skin stress by serial analysis of gene expression between mixtures of transcribed and optionally translated, genetically encoded factors (A) obtained from young and aged skin, to identify that genes that show strong differential expression. (A) comprises protein or mRNAs or their fragments. (M1) is useful for: identifying markers of skin ageing and/or stress; determining skin ageing and/or stress; and identifying or determining the effects of pharmacceutical or cosmetic agents for control of skin ageing. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Identifying genes involved in skin stress and aging, useful e.g. in screening for cosmetic or therapeutic agents, based on differential
                                       oligonucleotide that modulates hypoxia-inducible factor-lalpha, inl for treating e.g. cancer or Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; skin ageing; skin stress; EST; expressed sequence tag; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression (SAGE) so as to identify skin-expressed genes and quantify their expression. (M1) is useful for identifying genes involved in skin homeostasis to promotes skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sunburn; psoriasis; scleroderma; inchthyosis at some seathers and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag
sequence is one of a group of human skin ageing/stress related expressed sequence tags (ABQ86246-ABQ87680) of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to scrial analysis of gene expression (SAGE) so as to identify skin-expressed genes and quantify their expression. (M1) is useful for identifying genes involved in skin homeostasis; to promotes skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sunburn; psoriasis; scleroderma; ichthyosis; atopic dermatitis; acne; seborrhea; lupus erythematosus; rosaces; melanoma; basal cell carcinoma; and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         In vitro identification of skin-expressed genes, useful for determining homeostasis and identifying cosmetic or pharmaceutical agents against

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            à
```

```
The present sequence comprises the 5' or (preferably) 3' terminal hairpin loop region of anti-restenosis phosphorothioate oligomucleotides of the invention (see also ACCS9756-57). A claimed oligomucleotide for treating restenosis, e.g. in smooth muscle tissue, comprises a phosphorothioate modified oligomucleotide that includes at least one hairpin loop, a dr or dG releasing group and at least one multi-guanosine sequence. The oligomucleotide has a long active life in vivo due to the presence of the hairpin loop. It may be used as, or in, a coating on a device for implantation into the body, e.g. a stent for use in percutaneous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Anti-restenosis agent for treating restenosis e.g. in smooth muscle tissue, comprises a phosphorothioate-modified oligonucleotide comprising one hairpin loop and a dT or dG releasing group.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

The sequence is that of an antisense oligonucleotide which can be used for inhibiting growth or replication of herpesviruses. It corresponds to an antisense sequence of a herpesvirus site, pref. in a gene that is essential for synthesising nucleic acids e.g. the immediate early genes or Vmw65. It can be prepd. by solid phase triester or phosphor-amidite chemistry or by recombinant DNA techniques. It can be used for treating infection by herpesviruses, e.g. herpes simplex type 1 (HSV-1) and type 2 (HSV-2), varicella zoster (VSV), Betedin-Barr (BBV), cytomegalovirus (CMV), human herpesvirus 6 (HHV-6) and 7 (HHV-7). In addition, the thibitition of herpesvirus growth or replication may indirectly forestall the progression of events from HIV exposure to the clinical manifestation of AIDS. It may also be useful in the detection, diagnosis and manipulation of herpes virus. See also AAQ23764-Q23788 and AAQ24014-

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligomucleotides are used for disgnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010 ABC99989, ABF00010-ABF99989, ABH00010-ABF99989 and ABI00010-ABF82073

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABF99899, ABH00010-ABH99989 and ABI00010-ABI82073 tepresent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
represent the oligomers described in the invention. NOTE: The sequence data for this parent did not form part of the printed specification, but was obtained in electronic format from WIPO at ftp.wipo.int/pub/published_pct_sequences

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligomucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABF99989, ABH00010-ABF99989 and ABI00010-ABF82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at ftp.wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                             This invention describes novel oligonuclectide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretracted genomic DNA. The oligonuclectides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, contral nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABR00010-ABH99989 and ABI00010-ABI82073 tappesent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

                                                                                                                                                                                                                                                                                                                                                                                    This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABH99989 and ABI0010-ABH82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.

ö This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABH99989 and ABI00010-ABH82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at Gaps ö 14.3%; Score 11; DB 1; Length 13; 100.0%; Pred. New nucleic acids that interact, and optionally cleave, target sequences, used to treat cancer.

Claim 79; Page 99; 148pp; English.

The present invention describes nucleic acids (A) that interact stably with a target sequence and contain at least one phosphoro(di)thioate link, having endonuclease activity. (A), and more generally any catalytic nucleic acid (A') that modulates expression of the oestrogen receptor gene, are used to treat cancer (particularly of breast or endometrium), in vivo or by transforming cells ex vivo and implanting treated cells, or for other conditions associated with levels of oestrogen receptor. Because of the high selectivity for targeted RNA, (A) can also be used to correlate inhibition of gene expression with alterations in phenotype, particularly for identification of therapeutic targets, and as research

ö reagents (for RNA, in the same way that restriction endonucleases are used with DNA). The combination of modifications in (A) improves resistance to nucleases, binding affinity and/or activity. AAA23503 to AAA24147 represent cestrogen receptor hammerhead ribozyme sequences, and AAA24148 to AAA25992 represent their corresponding target sequences, AAAA2593 to AAA26105 represent cestrogen receptor hairpin ribozyme sequences, and AAAA2611 to AAA26218 represent their corresponding target sequences. AAA26219 to AAA26217 represent other ribozyme sequences and antisense oligonucleotides used in the exemplification of the present Gaps ö 14.3%; Score 11; DB 1; Length 14; 100.0%; Pred. Novel isolated Fanconi anemia protein complex polypeptide, termed FANCD2, useful for treating Fanconi anemia pathway defect in cell target or for treating patient with defective FANCD2 gene.

Claim 7; Page 54; 103pp; English.

The invention relates to an isolated Fanconi anaemia protein complex (FANCD2) polypeptide. The FANCD2 protein comprises a sequence of 1472 amino acids fully defined in the specification, its 90% identical sequence, a sequence encoded by a polynucleotide that is at least 90% identical to sequence sylven in specification such as a 5127 base pair sequence, or a fragment which is at least 50 amino acids in length. The FANCD2 protein is useful for treating an FA pathway defect in a cell target or for treating a patient with a defective FANCD2 gene. The FANCD2 protein and its gene are useful as a novel target for therapeutic development, and in diagnostic test and sercening assays for diseases associated with DNA repair and cell cycle abnormalities such as Fanconi anaemia, Bloom's syndrome, Cockayne's syndrome, Hereditary non-polyposis

angioplastic restenosis. By inhibiting CETP, the levels of HDL and low density lipoproteins (LDL), and the HDL:LDL ratio are favourably altered (a decrease in LDL levels, and a corresponding increase in HDL levels). The HH ribozymes can also be used diagnostically to study genetic drift and mutations in diseased cells, and to detect CETP mRNA. As the HH ribozymes target specific regions of the CETP gene, they have low nonspecific activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel ribozymes for the treatment of diseases and conditions related to hepatitis C infection.

The HCV sequence was screened for optimal ribozyme target sites using a computer folding algorithm and regions of the mRNA which did not form secondary folding structures and contained potential ribozyme cleavage sites were identified. Ribozymes were synthesised to target these sites and their activities optimised by either varying the target these sites and their activities optimised by either varying the carget of the binding arms or by modification to prevent degradation by nucleases. The ribozymes of the invention inhibit gene expression and/or viral replication, and are used to treat diseases associated with Hepatitis C virus (HCV) infection, e.g. cirrhosis, liver failure and hepatitis C virus (HCV) infection, other infectious diseases, autoimmune diseases, and cancer

character nucleic acid, especially a hammerhead ribozyme, which cleaves the Hepatitis C virus (HCV) RNA sequence at the base position given in the Hepatitis C virus (HCV) RNA sequence at the base position given in the Hepatitis C virus (HCV) RNA sequence was screened for optimal ribozyme c arget sites using a computer folding algorithm and regions of the mRNA which did not form secondary folding structures and contained potential ribozyme cleavage sites were identified. Ribozymes were synthesised to target these sites and their activities optimised by either varying the target these sites and their activities optimised by either varying the rarget these sites and their activities optimised by either varying the rarget these sites and their activities optimised by either varying the nucleases. The ribozymes of the invention inhibit gene expression and/or viral replication, and are used to treat diseases associated with Hepatocellular carcinoma. The ribozymes may be used in combination with interferon to treat HCV infection, other infectious diseases, autoimmune diseases, and cancer ö Novel ribozymes for the treatment of diseases and conditions related to Gaps The present sequence represents the preferred target sequence of an Claim 1; Page 89; 123pp; English. hepatitis Cinfection. colon cancer, ataxia telangiectasia and Xeroderma pigmentosum. The FANCD2 gene is useful in producing probes and primers for screening patients in genetic based test, for diagnosing Fanconi anaemia and cancer, for preparing an experimental mouse model for use in screening new in gene therapy methods. A recombinant vector containing the FANCD2 gene of the invention is useful in gene therapy. This polymucleotide sequence represents a FANCD intron/exon junction oligonucleotide relating to the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a novel method of diagnosing or determining if a patient has cancer or is at increased risk of cancer, involving testing a Fanconi Anaemia (FA)/BRCA pathway gene or protein for the presence of a cancer-associated defect, where the presence of one or more cancer-associated defects is indicative of cancer or an increased risk of cancer in the patient. The method of the invention has cytostatic activity. The method is useful for determining if a patient has cancer, or is at increased risk of developing cancer, e.g. breat, ovarian or prostate cancer. A microarray of the invention is useful for determining if a patient has cancer, or is at increased risk of developing cancer, by hybridising a nucleic acid sample to the nucleic acid sequences from the array, and detecting the presence of mutations in RA/BRCA pathway genes in the nucleic acid sample from the patient, where detecting the presence of mutations is indicative of a patient who has cancer, or is at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Diagnosing or determining cancer or increased risk of cancer in a patient, by testing Fanconi Anemia/BRCA pathway gene or protein for cancer-associated defect, that indicates cancer or increased risk of

cerer transfer protein (CERT) hammardened (HH) ribozymes (See AAT99881-
CE TS0137). CETP is a 74 kD glycoprotein that facilitates neutral lipid
cransfer between plasma lipoproteins. The numbering of the targets refers
to the position of the cleavage site in full length CETP. The ribozyme
binds to 5 nucleotides either side of this site, provided the sequence UH
cc is immediately upstream. The ribozymes are able to cleave mRNA from the
gene encoding CETP, thereby blocking synthesis and/or expression of the
mRNA. By inhibiting CETP, the reverse cholesterol transport (RCT) pathway
cc an be inhibited (or eliminated) thereby preventing the reduction in size
density of the high density lipoproteins (HDL), prolonging HDL half life,
and therefore increasing HDL levels The ribozymes can be used to treat
conditions associated with abnormal levels of CETP, specifically familial
typercholesterolaemia, atherosoclerosis, peripheral vascular disease,
typercholesterolaemia, hyposlophalipoproteinsemia, dyslipidaemia,
vascular complications of diabetes, transplant, atherectomy and
                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Hammerhead ribozyme; cholesterol ester transfer protein; mRNA cleavage; neurral lipid transfer; plasma lipoprotein; atheroselerosis; atherectomy; reverse cholesterol transport; high density lipoprotein; therapy; CETP; familial hypercholesterolaemia; dyslipidaemia; hypoalphalipoproteinaemia; peripheral vascular disease; hyperbetalipoproteinaemia; RCT; inhibitor; angioplastic restenosis; low density lipoprotein; diabetes; HDL; human;
increased risk of developing cancer. A method of the invention is useful
                    for screening a chemosensitising agent, and the agent obtained is useful for treating a patient having a cancer. The present sequence is used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New ribozyme(s) for cleaving cholesterol ester transfer protein mRNA useful for preventing or treating initial development, progression or regression of vascular diseases, esp. familial hypercholesterolaemia.
                                                                                                                                                                               Gaps

Genotyping protease inhibitor 4 gene of individual for determining haplotype of individual, involves determining identity of nucleotide pair at specific polymorphic sites for two copies of gene.

Claim 16; Page 13; 79pp; English.

The present invention relates to genotyping procease inhibitor (PI) 4

(kallistatin) gene of an individual, involves determining for the two
copies of the PI4 gene present in the individual, the identity of the
nucleotide pair at one or more polymorphic sites. PI4 gene is located on
chromosome 14q1-q32.1. Genotyping is useful for determining if an
individual has a haplotype or haplotype pairs defined in the
specification. Haplotyping is useful for improving the efficacy and
reliability of several steps in the discovery and development of drugs
for treating diseases associated with PI4 activity, e.g. acute
pancreatitis, to validate PI4 as a candidate agent for treating a
specific condition or disease predicted to be associated with PI4
activity, and in the design of clinical trials of candidate drugs for
treating a specific condition or disease predicted to be associated with
PI4 activity. The PI4 gene is useful in studying the expression and
function of PI4, and in expressing PI4 protein for use in screening for
candidate drugs to treat diseases related to PI4 activity. The present sequence is a ASO (alle PI4 gene polymorphisms

Novel genetic variants of cholinergic receptor, nicotinic, epsilon polypeptide gene useful in studying expression and function of the protein, and for screening drugs to treat diseases e.g. congential myasthenic syndrome

Claim 17; Page 14; 104pp; English.

The invention relates to a method for haplotyping the cholinergic receptor, nicotinic, epsilon polypeptide (CHRNE) gene (ABL88268) of an individual, and also describes 17 novel polymorphic sites within the human CHRNE gene. The CHRNE gene is located on chromosone 17p13-12 and contains 12 exons which encode a 493 amino acid protein (ABB49112). The CHRNE gene is located on chromosone 17p13-12 and contains 12 exons which encode a 493 amino acid protein (ABB49112). The CHRNE protein is one of the 5 subunits of mammalian acetylcholine acetylcholine acetylcholine acetylcholine acetylcholine receptors (AChRs) found at neuromwascular junctions in juveniles and adults, and is essential for the normal postnatal development of skeletal muscle. Mutations in the CHRNE gene are associated with congenital compact that can be used in gene therapy. The CHRNE gene is also useful for studying the expression and function of CHRNE, and in expressing CHRNE protein for use in correcting for candidate drugs to treat diseases related to CHRNE. The method of the invention is useful for haplotyping the CHRNE gene in an individual, and can also be used in pharmaceutical research to validate candidate drugs for, treating a specific condition drugs or disease confident educes (AERNE activity such as CMS. Polymorphisms in the target region may be determined by the use of allele-specific condidate (ABL88370-ABL88320) as probes and primers, and by primer extension using oligomuclectide primers comprising sequences ABL88371-ABL88331. The charge of several steps in the drug or disease. development of drugs for treating diseases associated with CHRNB activity, and may be used to screen drugs which target CHRNB. Sequences ABL88287-ABL88320 represent specifically claimed allele-specific oligonucloetide (ASO) primers used for detecting polymorphisms in the CHRNE gene

The present invention relates to enzymatic nucleic acids which specifically cleave RNA derived from Hepatitis C virus (HCV). The enzymatic nucleic acid or ribozyme is in a hammerhead (HH) or hairpin of the substrate sequences defined in the specification. The HCV is the substrate sequences defined in the specification. The HCV is the substrate sequences defined in the specification. The HCV is the substrate sequences defined in the specification. The HCV is they can be used to treat cirrhosis, liver failure and/or replication of HCV. They can be used to treat cirrhosis, liver failure and/or reating a condition associated with HCV infection in conjunction with one or more contert drug therapies, particularly type I interferon, especially interferon alpha, beta or gamma or consensus interferon. The present sequence represents a substrate for a HCV hammerhead (HH) ribozyme. Note: Some of the sequence data for this patent was printed specification. The complete sequence data for this patent was obtained in electronic format directly from the USPTO web site at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New ribozymes targeting RNA derived from hepatitis C virus inhibit viral replication and are useful to treat hepatitis C virus infections and cirrhosis, liver failure or hepatocellular carcinoma.
                                                                                                                                                                                                                                                                                                                                                                     Enzymatic nucleic acid, RNA cleavage, Hepatitis C virus infection, HCV ribozyme, HCV expression, HCV replication, cirrhosis, virucide, liver failure, hepatocellular carcinoma, HCV infection, drug therapy, type I interferon, interferon alpha, interferon beta, cytostatic; interferon gamma, consensus interferon, hepatotropic, antiinflammatory, substrate, hammerhead ribozyme, HH ribozyme, ss.

The present invention relates to enzymatic nucleic acids which specifically cleave RNA derived from Hepatitis C virus (HCV). The carzymatic nucleic acid or ribozyme is in a hammerhead (HH) or hairpin (HP) motif where the binding arms comprise sequences complementary to one of the substrate sequences defined in the specification. The HCV itbozymes are useful for modulating the expression and/or replication of HCV. They can be used to treat cirthosis, liver failure and/or replication of hepatocellular carcinoma. The HCV ribozymes are also useful for treating a condition associated with HCV infection in conjunction with one or more other drug therapies, particularly type I interferon, especially interferon alpha, beta or gamma or consensus interferon. The present sequence represents a substrate for a HCV hammerhead (HH) ribozyme. Some of the sequence data for this patent did not form part of the printed specification. The complete sequence data for this patent was obtained in electronic format directly from the USPTO web site at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New ribozymes targeting RNA derived from hepatitis C virus inhibit viral replication and are useful to treat hepatitis C virus infections and cirrhosis, liver failure or hepatocellular carcinoma.
                                                                                                                                                                                          Enzymatic nucleic acid; RNA cleavage; Hepatitis C virus infection; HCV ribosyme; HCV expression; HCV replication; cirrhosis; virucide; liver failure; hepatocellular carcinoma; HCV infection; drug therapy; type I interferon; interferon alpha; interferon beta; cytostatic; interferon gamma; consensus interferon; hepatotropic; antiinflammatory; substrate; hammerhead ribozyme; HH ribozyme; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                       Hepatitis C virus substrate #1179 for HCV hammerhead ribozyme #1179.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ä

comprising the novel enzymatic nucleic acid; (2) an ammalian cell including the novel enzymatic nucleic acid; (3) an expression vector comprising a nucleic acid sequence encoding at least one enzymatic comprising a nucleic acid sequence encoding at least one enzymatic comprising a nucleic acid sequence encoding at least one enzymatic comprising a nucleic acid sequence encoding at least one fit at mammalian cell including an expression of that concluding an expression of that comprising controlle, (4) a mammalian cell including an expression vector of (3); (6) a method of treating a patient having a condition associated with HCV infection, by contacting cells of the patient with the nucleic acid molecule, and further employing one or more drug therapies; (7) a method for inhibiting HCV replication in a mammalian cell by administering the novel enzymatic nucleic acid; and (8) a method of cell by administering the expression and/or replication of hepatitis C nucleic acid with the separate RNA molecule. The enzymatic nucleic acid is useful for modulating the expression and/or replication of hepatitis C nucleic acid may also be used to treat or prevent the occurrence of a disease state in a patient. The present sequence represents an HCV and a patient. The present sequence represents an HCV and a patient. The present sequence represents an HCV and a patient. The present sequence represents an HCV and a patient. The present sequence represents an HCV and a patient sequence represents and the present and present sequence which is used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an enzymatic nucleic acid molecule which specifically cleaves minus strand RNA derived from hepatitis C virus HCV). The binding arms of the molecule comprise ribozyme sequences. The molecule is selected from inozyme, G-cleaver, DNAzyme, Amberzyme, and Zinzyme motifs. Also described: (1) a pharmaceutical composition.
                                                                                                                                                                                                                     ribozyme; enzymatic nucleic acid molecule; hepatitis C virus infection; antiviral; gene therapy; substrate; ss.

The invention relates to an enzymatic nucleic acid molecule which specifically cleaves minus strand RNA derived from hepatitis C virus (HCV). The binding arms of the molecule comprise tibozyme sequences. The molecule is selected from inozyme, G-cleaver, DNAzyme, Amberzyme, and C zinzyme motifs. Also described: (1) a pharmaceutical composition comprising the novel enzymatic nucleic acid; (2) a mammalian cell including the novel enzymatic nucleic acid; (3) an expression vector comprising a nucleic acid sequence encoding at least one enzymatic nucleic acid molecule, (4) a mammalian call including at least one enzymatic molecule; (4) a mammalian call including an expression vector of (3); (5) methods for treating co patient the novel enzymatic nucleic acid or the vector of (3); (6) a method of treating a patient having a condition associated with HCV infection, by contacting cells of the patient with cell manufacting the novel enzymatic nucleic acid or the novel enzymatic nucleic acid and contacting the novel enzymatic nucleic acid and contacting the novel enzymatic nucleic acid with the separate RNA molecule. The enzymatic nucleic acid with the separate RNA molecule. The enzymatic nucleic acid with the separate RNA molecule. The enzymatic nucleic acid with the separate RNA molecule. The enzymatic nucleic acid with the separate RNA molecule. The enzymatic nucleic acid with the separate RNA molecule. The enzymatic nucleic acid with the separate RNA molecule. The enzymatic nucleic acid with the separate RNA molecule. The enzymatic nucleic acid with the separate RNA molecule. The enzymatic nucleic acid with the separate RNA molecule. The enzymatic nucleic acid with the separate RNA molecule. The enzymatic nucleic acid with the separate RNA molecule. The enzymatic nucleic acid with the separate RNA molecule. The enzymatic nucleic acid with the separate sequence represents an HCV winns strand. The nucleic acid may also be used to treat or prevent the occurrence of a disease state in a patient. The present sequence repre exemplification of the present invention

The present sequence represents a preferred target sequence for an enzymatic nucleic acid (i.e. a ribozyme) which cleaves interleukin-5 (IL-5) mRNA at the nucleotide base position indicated in the DE line. Regions to the mRNA that do not form secondary folding structures and that contain potential hammerhead and hairpin ribozyme cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designed and synthesised with modifications that improve their nuclease resistance. The ribozymes cleave the IL-5 target sequences and thereby inhibit IL-5 expression, making them useful for treating chronic asthma, e.g. by inhibiting the synthesis of IL-5 in lymphocytes and preventing the recruitment and activation of eosinophils. The ribozymes can also be used to treat cosinophilia (related to parasitic infection or with pulmonary infiltration) and L-tryptophan-associated cosinophilia-myalgia syndrome. Regions of the mRNA that do not form secondary folding structures and that contain potential hammerhead and hairpin ribozyme cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designance. The ribozymes directed against these mRNA sequences were designance. The ribozymes cleave the IL-5 target sequences and thereby inhibit IL-5 expression, making them useful for treating chronic asthma, e.g. by inhibiting the synthesis of IL-5 in lymphocytes and preventing the recruitment and activation of ecsinophils. The ribozymes can also be used to treat cosinophila (related to parasitic infection or with pulmonary infiltration) and L-tryptophan-associated essinophilia-myalgia syndrome. (RIBO-) RIBOZYME PHARM INC.

## WPI; 1995-351090/45.

Ribozymes having modified bases and methods for producing them - for in inhibiting disease related genes.

## Claim 2; Page 229; 407pp; English.

용 ò

The present sequence represents a preferred target sequence for an enzymatic nucleic acid (i.e. a ribozyme) which cleaves relA mRNA at the enzymatic nucleic acid (i.e. a ribozyme) which cleaves relA mRNA at the nucleotide base position indicated in the DB line. The relA gene product is a subunit of the transcriptional regulator NP-kappaB and is implicated specifically in the induction of inflammatory responses. Regions of the mRNA that do not form secondary folding structures and that contain potential hammerhead and halrpin ribozyme eleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designed and synthesised with modifications that improve their nuclease resistance. The ribozymes are designed to cleave their capteneds and thereby inhibit relA expression, making them potentially useful for treating rheumatoid arthritis, restenosis and asthma as well as for increasing tolerance to transplanted tissues. The potential and that uses are limited to local delivery, acute indications or ex vivo treatment. (Updated on 25-MAR-2003 to correct PI field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence represents the preferred target sequence of an enzymatic nucleic acid, especially a hammerhead ribozyme, which cleaves the Hepatitis C virus (HCV) RNA sequence at the base position given in the descriptor line. The HCV sequence was screened for optimal ribozyme target sites using a computer folding algorithm and regions of the mRNA which did not form secondary folding structures and contained potential ribozyme cleavage sites were identified. Ribozymes were synthesised to target these sites and their activities optimised by either varying the length of the binding arms or by modification to prevent degradation by nucleases. The ribozymes of the invention inhibit gene expression and/or viral replication, and are used to treat diseases associated with hepatitic virus (HCV) infection, e.g. cirrhosis, liver failure and hepatocellular carcinoma. The ribozymes may be used in combination with interferon to treat HCV infection, other infectious diseases, autoimmune

The invention relates to the isolation of sequences encoding human haemopoietin receptor protein family NR8 genes. The NR8 family sequences were initially searched for comparison on a nucleic acid database with the nucleic acid probe sequence TGABGYNNNTGABGY encoding the amino acid sequence Trp-Ser. The sequences AAZ59258-Z59300 and AA290816-280925 expresent specific examples of probe sequences used in the search. Antibodies to the NR8 family proteins are used for the diagnosis of blood formation disorders. Compounds identified as binding to the proteins are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Hemopoietin receptor protein family NR8 used for diagnosis of blood formation disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           snediyne C-1027 biosynthesis gene cluster; apoprotein; chromophore;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Antisense therapy; antiproliferative; antinflammatory; antipsoriatic; cytostatic; dermatological; cardiant; virucide; ophthalmological; keloid; skin disorder; Insulin-like Growth Factor I receptor; IGF-1; pitzyisais; IGF binding protein; IGFB-2; IGFBB3; inflammation; psoriasis; pilatis; growth factor mediated cell proliferation; ichthyosis; serborrhoea; ruba; keatosis; neoplasia; scleroderma; wart; skin cancer; sclerotic disease; hyperneovascular condition; hyperplasis; kidney disease; neoblation of the retina; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention is concerned with the elucidation of the gene cluster from Streptomyces globisporus which regulates enediyne C-1027 synthesis. Enediyne C-1027 is an antibiotic, consisting of an apoprotein and a non-peptidic chromophore, which causes damage to DNA. The primers AAA63353-A63451 were used to isolate the open reading frames which used the gene cluster. The sequences within the gene cluster can be used to produce the protein and to identify antagonists, both of which can be used in the treatment of cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Isolated nucleic acid comprising a nucleic acid encoding any of C-1027 open reading frames (ORFs) -7 to 42, excluding ORF 9 (cagA), useful for the production of enediyne C-1027 antitumor antibiotics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonuclectide, (for Insulin-like Growth Factor [IGR]-1.

Teceptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of infibiting or reducing growth factor mediated cell proliferation, clipmunation and/or other disorders. The present sequence is an oligonuclectide which can be used to design the antisense of infibiting or rectide is used to design the antisense oligonuclectides of the present invention (see AAF45151 and AAF45153-CPF5161). The method is useful for ameliorating the effects of psoriasis, inchtyposis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, seleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood

vessels or any other hyperplasia 21-JUN-2000; 2000WO-AU000693. IGF-I oligonucleotide #775. 21-JUN-1999; 28-DEC-2000 AAF49815; 33 RESULT 183 셤

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotide which can be used to design the antisense oligonucleotide of the present invention (see AAF45151 and AAF45153-F45161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperproliferation of the retina, brain or skin, growth factor-mediated mainsancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or Example 8; Page 84; 201pp; English. Ameliorating the UV (ultra...' inflammation.

Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or inflammation.

Example 7; Page 45; 201pp; English.

The present invention relates to a method for ameliorating the effects of

```
ö
skin disorders. The method comprises contacting the skin with an antisense oligonuclectide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFB]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotide of the present invention (see AAF45151 and AAF45153-F55161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasis, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperplasia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Antisense therapy; antiproliferative; antiinflammatory; antipsoriatic; cytostatic; dermatological; cardiant; virucide; ophthalmological; keloid; skin disorder; Insulin-like Growth Factor I receptor; IGF-1; pityriasis; IGF binding procein; IGFBP-2; IGFBP3; inflammation; psoriasis; pilatis; growth factor mediated cell proliferation; ichthyosis; serborrhoea; ruba; keratosis, neoplasia; scleroderma; wart; skin cancer; sclerotic disease; hyperneovascular condition; hyperplasis; kidney disease; neoblation of the retina; ss.

Ameliorating the effects of a disorder, e.g. psoriasis, by administering JV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or

Edmondson SR;

Wraight CJ, Werther GA,

WPI; 2001-041421/05.

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonorelectide, (for Insulin-IRA Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation,

The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGF8P]-2 or IGF8P3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF45151 and AAF45153-F45161). The method is useful for ameliorating the effects of psoriasis,
inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF45151 and AAF45153-P45161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Antisense therapy; antiproliferative; antinflammatory; antipsoriatic; cytostatic; dermatological; cardiant; virucide; ophthalmological; keloid; skin disorder; Insulin-like Growth Factor I receptor; IGF-1; pityriasis; IGF binding protein; IGFB-2; IGFBP3; inflammation; psoriasis; pilatis; growth factor mediated cell proliferation; ichthyosis; serborrhoea; ruba; kearsolsis; neoplasia; selaroderma; wart; skin cancer; sclerotic disease; hypermeovascular condition; hyperplasia; kidney disease; neovascular condition of the retina; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or

Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or inflammation.

Example 8; Page 84; 201pp; English.

skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP], which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF45151 and AAF45153-F45161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasiss, cleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic The present invention relates to a method for ameliorating the effects of AAP52666

Wraight CJ,

Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or

Example 8; Page 71; 201pp; English.

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGFP-1] receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation.

CC oligonucleotide which can be used to design the antisense oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAP45151 and AAP45153-CP F45161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, chthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, bypernecvascular condition such as a necvascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood or any other hyperplasia vessels
